

# Calculating probabilities using the binomial distribution

## Learning objectives

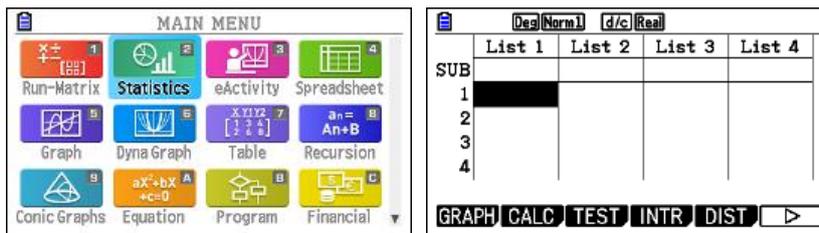

How to calculate probabilities and cumulative probabilities using the binomial distribution;  
Using the inverse binomial distribution and Table mode to find critical regions for a hypothesis test.

This worksheet accompanies the video *Binomial Distribution Probability and Hypothesis Testing*.  
We suggest you watch it first.

## How to use the distribution menu in Statistics mode for the binomial distribution

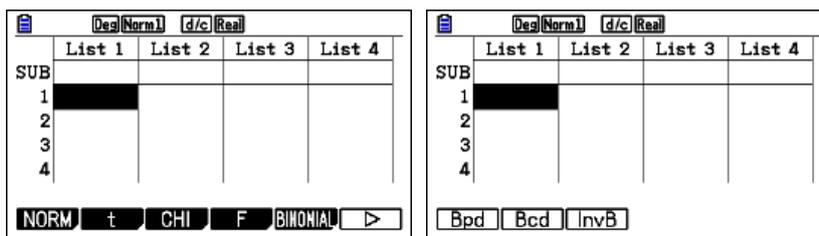

Press **MENU** and choose **Statistics**.

Choose **DIST** (**F5**).

In this example, the random variable  $X$  is taken from a binomial distribution with 10 trials and probability 0.6 of success. Find  $P(X = 7)$  when  $X \sim B(10, 0.6)$ .

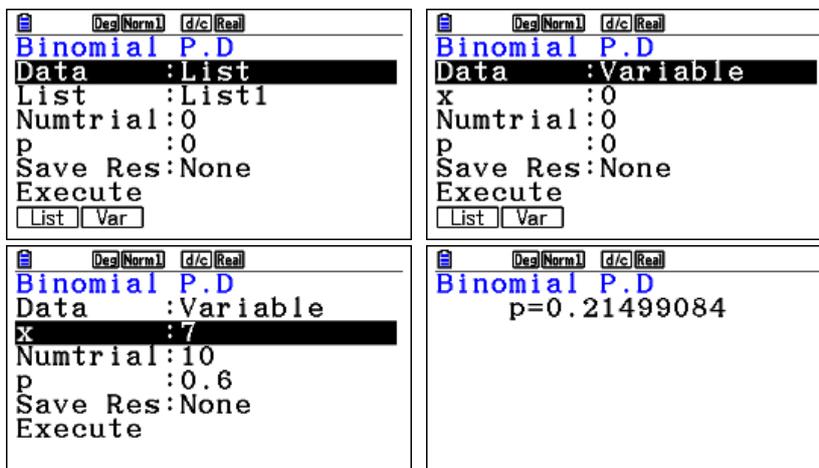

Choose **BINOMIAL** (**F5**) followed by **Bpd** (**F1**).

For **Data**, choose **Var** (**F2**).

Enter the value of  $x$  and the parameters **Numtrial**: ( $n = 10$ ) and **p**: 0.6.

Press **EXE**.

Press **EXE** again to return to the previous screen and change the value of  $x$  as required.

## Finding cumulative probabilities using the distribution menu in Statistics mode

In this example, the random variable  $X$  is taken from a binomial distribution with 10 trials and probability 0.6 of success. Find  $P(X \leq 7)$  when  $X \sim B(10, 0.6)$ .

Return to the Statistics main screen by pressing **EXIT** twice.

Choose **DIST**, **BINOMIAL** and **Bcd**.

	List 1	List 2	List 3	List 4
SUB				
1				
2				
3				
4				

Bpd Bcd InvB

Choose **Var**, the range of values of  $x$ , and the parameters **Numtrial**: ( $n = 10$ ) and **p**: 0.6. Press **EXE**.

	Rad(Norm1)	d/c(Real)
<b>Binomial C.D</b>		
Data	:Variable	
Lower	:0	
Upper	:0	
Numtrial	:10	
p	:0.6	
Save Res	:None	
	List	Var

	Deg(Norm1)	d/c(Real)
<b>Binomial C.D</b>		
Data	:Variable	
Lower	:0	
Upper	:7

p	:0.6	
Save Res	:None	

	Deg(Norm1)	d/c(Real)
<b>Binomial C.D</b>		
p=0.83271024		

Press **EXE** again to return to the previous screen and change the value of  $x$  as required.

## How to use trial and error for cumulative probabilities for a two-tail hypothesis test

In this example, the null hypothesis states that the probability of success is 0.5 and there are 50 trials. We wish to find the critical region for a two tailed test at the 10% significance level.

$$H_0 : p = 0.5 \quad H_1 : p \neq 0.5$$

Press **EXIT** twice again to return to the main Statistics screen.

Choose **DIST** (**F5**), followed by **BINOMIAL** and **Bcd**.

	List 1	List 2	List 3	List 4
SUB				
1				
2				
3				
4				

Bpd Bcd InvB

We need a cumulative probability at each end of 5%.

Check **Var** is chosen and set the parameters **Numtrial**: ( $n = 50$ ) and **p**: 0.5.

For the left tail, keep the **Lower** value of  $X$  at 0 and change the **Upper** value until you have seen values either side of 5% (0.05).

	Deg(Norm1)	d/c(Real)
<b>Binomial C.D</b>		
Data	:Variable	
Lower	:0	
Upper	:18	
Numtrial	:50	
p	:0.5	
Save Res	:List1	

	Deg(Norm1)	d/c(Real)
<b>Binomial C.D</b>		
p=0.03245432		

	Deg(Norm1)	d/c(Real)
<b>Binomial C.D</b>		
Data	:Variable	
Lower	:0	
Upper	:19	
Numtrial	:50	
p	:0.5	
Save Res	:List1	

	Deg(Norm1)	d/c(Real)
<b>Binomial C.D</b>		
p=0.05946022		

At the right tail, input the **Upper** value at 50 and change the **Lower** value until you have seen values either side of 5% (0.05)

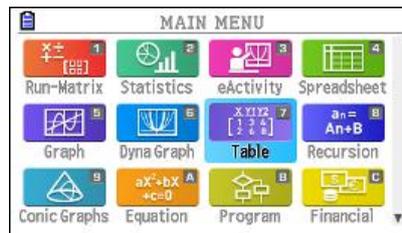

The values of  $X$  which form the critical regions are 0 to 18 and 32 to 50 inclusive.

Notice that these are symmetrically placed either side of 25, the expected number of heads. In cases where the probability is not 0.5, the tails can contain very different number of values for equal probabilities.

### Taking it further – showing a list of cumulative probabilities in Table mode

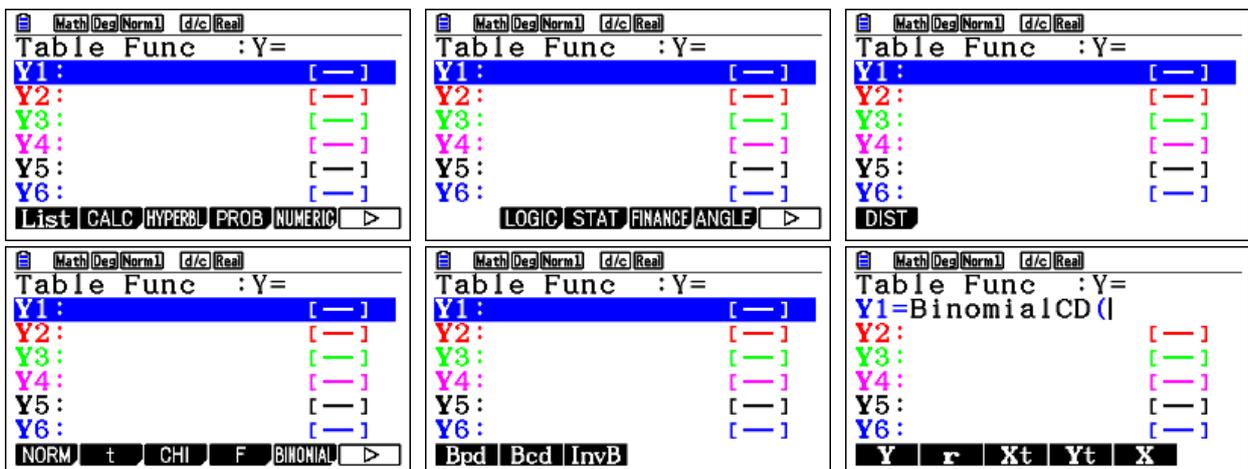

Critical regions are easier if you have a list of cumulative binomial probabilities similar to those published in statistical tables,  $P(X \leq x)$ . You can also create a list of probabilities for regions at the top end  $P(X \geq x)$  from which you can easily see the critical region at the top end.

Press **MENU** and choose **Table**.

To find the binomial cumulative probabilities, press **OPTN** and choose the further menu **▷** (**F6**) for the second set of menu choices.

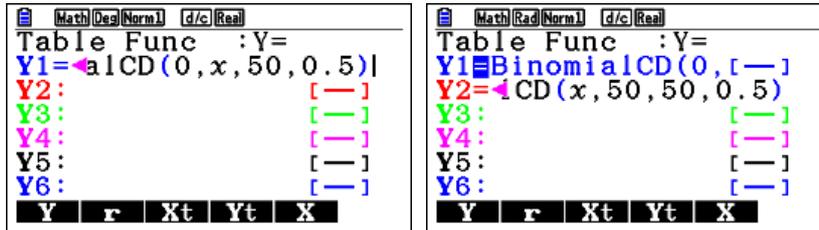

From here, choose **STAT** (**F3**) followed by **DIST** (**F1**), **BINOMIAL** (**F5**) and then **Bcd** (**F2**).

For **Y1**, enter the information in the following order – lower value **0**, upper value  **$x$**  (using the **X.θ.T** key for  $x$ ), the number of trials **50** and the probability of success **0.5**, each separated by a comma. (If you forget the order, check how Statistics mode asks for the values – it the same order here.)

Close the bracket and press **EXE**.

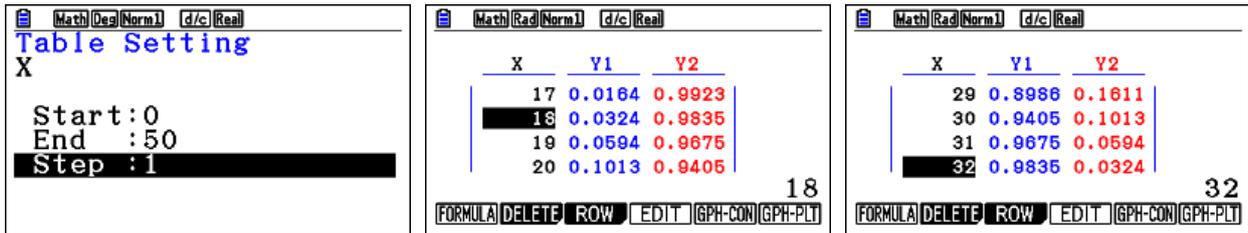

For **Y2**, repeat the same steps as above, but setting lower value  **$x$** , upper value **50**, the number of trials **50** and the probability of success **0.5**, each separated by a comma.

To create a table for all the values, choose **SET** and input **Start: 0**, **End: 50** and **Step: 1**.

Press **EXE** to enter the values and choose **TABLE** (**F6**) to see the table of values.

Scroll across to see each value to more decimal places and down to see other rows on the table.

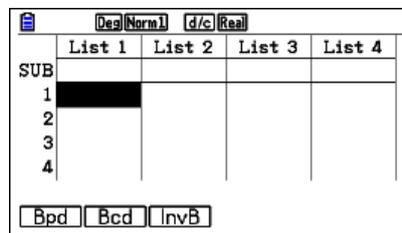

Notice that the values on each row add up to more than 1, as the probability of taking the  $X$  value is included in both sets. The value in **Y1** and the **Y2** from the row below add up to 1.

Scroll down until you see where the probabilities **Y1** change from below 5% to above 5% and at the top from above 5% to below 5%. So, the lower tail of the critical region is {0, 1, 2, ... 18} and the upper tail consists of values above 31 so {32, 33, ... 50}.

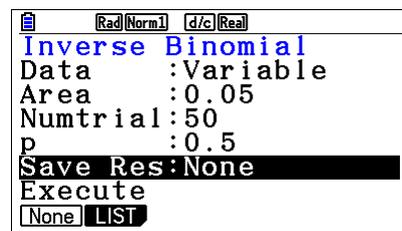

### Taking it further – using inverse Binomial probabilities

Press **MENU** and choose **Statistics**.

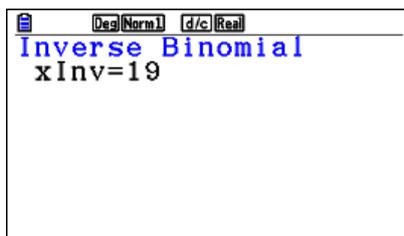

Choose **DIST** followed by **BINOMIAL** and **InvB** (**F3**).

To find the critical values at the lower end, set the value of **Area** to **0.05**, and set the parameters **Numtrial:** ( $n = 50$ ) and **p:** **0.5**.

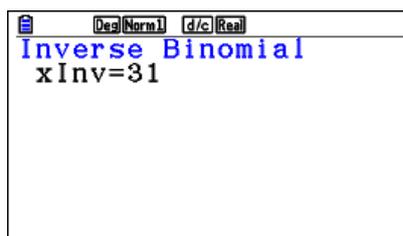

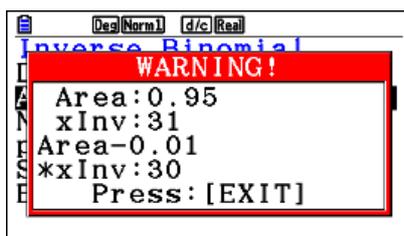

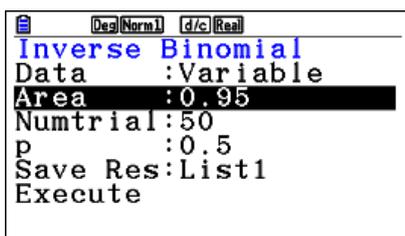

Press **EXE**.

This is the value of  $X$  for which the probability is closest to 0.05 – in this case it is the one for which the probability is just over 0.05 – so it is important to find the actual probability  $P(X \leq 19)$  before deciding which values lie in the critical region. It is important to record the probabilities either side of 0.05 in your written answer as evidence that your answer is correct.

For the other tail, select an area of 0.95 and press **EXE**.

A warning will appear as the probability  $P(X \leq 30)$  is more than 0.01 away from the 0.95 that we are looking for.

Again, it is necessary to check the exact values of probability before deciding which values lie in the critical region. It is important to record the probabilities either side of 0.05 in your written answer as evidence that your answer is correct for both tails.
